

Presentation plan

1. Project idea
2. Technical stack
3. Key data concepts
4. The need
5. Proposed solution and practice
6. Expected results

Technical stack

What we know

Project part	Information
Application type	Art Gallery / Portfolio App
Main data entities	Artist, Artwork, ArtMedium
Project owner	Badreddine Hammam

To be confirmed

The programming language, framework, database, and development tools were not included in the project information.

Add the real technologies here when they are confirmed.

Key concepts

Concept	Simple meaning
Artist	A person who creates art.
Artwork	A creative piece, such as a painting or sculpture.
ArtMedium	The material or method used to make an artwork, such as oil paint.
Portfolio	A selected collection of an artist's work.

Example: An artist's portfolio can show an artwork and the medium used to create it.

The need

The challenge

Artists and visitors need a clear way to find and understand creative work.

The goal

Build a portfolio application that brings artist profiles, artworks, and art mediums together.

- Keep art information organized.
- Show who created each artwork.
- Describe the medium used for each piece.
- Make the collection easier to explore.

Proposed solution and practice

Three connected data entities

Artist → creates → **Artwork** → uses → **ArtMedium**

Suggested development steps

1. Define the information stored for each entity.
2. Confirm how artists, artworks, and mediums are related.
3. Build the application with the chosen technology stack.
4. Add sample records and check that they display correctly.

These relationships and steps are a proposal; confirm them against the final design.

Expected results

- Artist information can be organized.
- Artworks can be presented as a portfolio.
- Each artwork can show its art medium.
- The project owner is **Badreddine Hammam**.

Next steps

Confirm the technology stack, finalize the data relationships, and add real application screenshots.

Thank you
